InfoSlider

InfoSlider

The InfoSlider is the perfect medium for presentations aimed at providing detailed information after establishing a general impression. It consists of a monitor mounted in front of a large illuminated display on which individual information can be printed. Visitors can slide the monitor back and forth on the x- and the y-axis, and at predefined positions it will display additional information like films, photos and texts. In the version equipped with a touchscreen monitor, the InfoSlider also allows for direct access to the Internet. This enables visitors to independently research complex topics in a playful manner.
